4 Pillars of AI-Enhanced Power BI Development

Code formats

Transitioning from binary files to text-based PBIP.

Unblocks source-control and allows AI assistants to read and write to the code.

Automation

Facilitate automated collaboration and powerful CI/CD pipelines.

Allow AI to deploy and test in development environments – creating powerful agentic loops.

Connectors

MCP connect AI Agents to Power BI, enabling them to read semantic model schemas, understand relationships, and query while respecting existing security and governance.

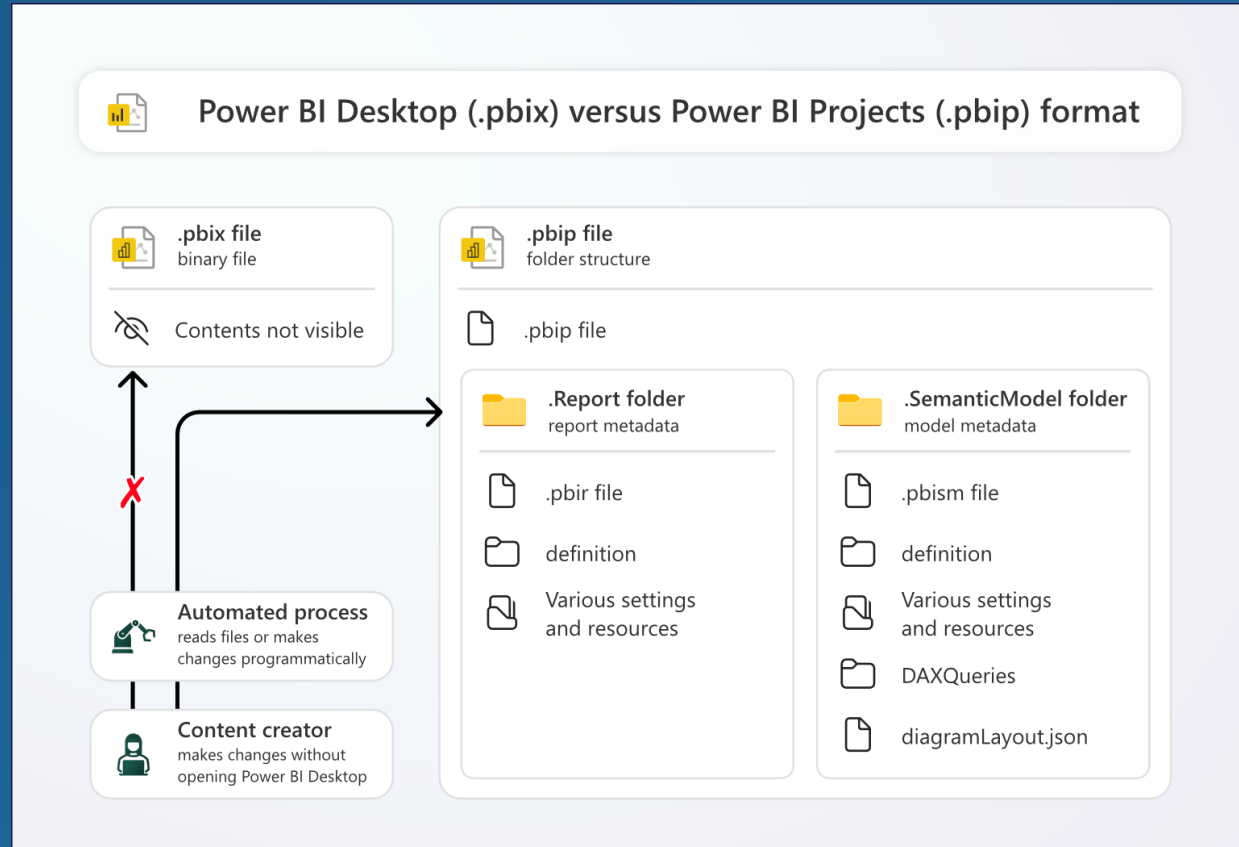

Workflows

Inject your team domain expertise into the AI using skills. Developers steer the agent to generate highly personalized, relevant, and accurate outputs.

Power BI Project (PBIP)

Open, documented code formats for reports (PBIR) and semantic models (TMDL).

- Code-behind of Power BI
- Code changes are supported
- Unblocks collaboration and powerful CI/CD flows

GA planned for Q3 2026

Tabular Model Definition Language (TMDL)

Declarative & Readable

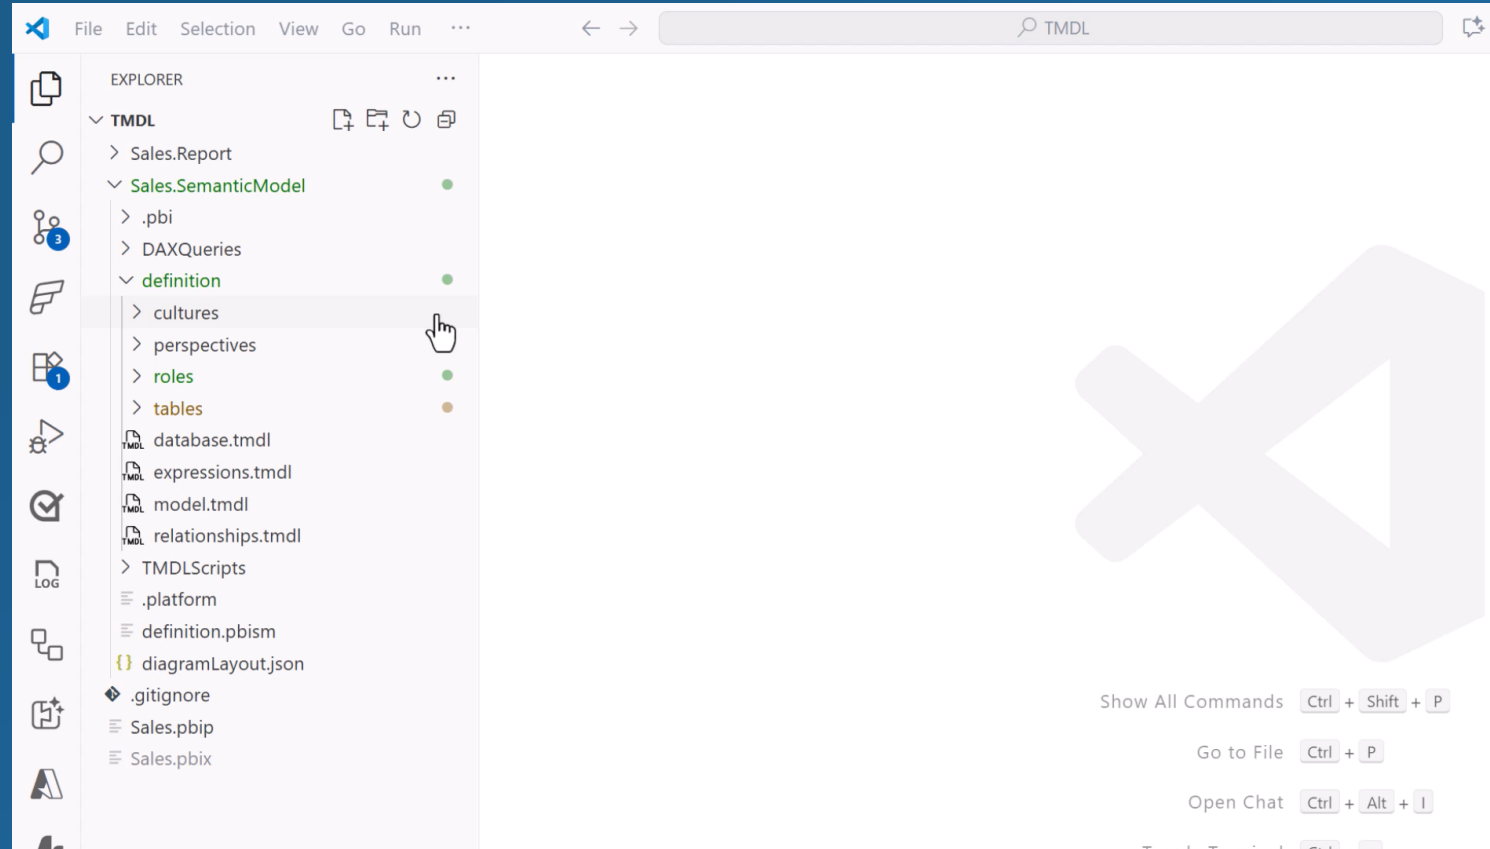

Define semantic models using clean, human-friendly text files

Modular & Reusable

Reuse model components across projects to drive consistency and efficiency

Built for Collaboration

Track changes, review diffs, and manage versions with Git

Power BI enhanced Report format (PBIR)

Public & Documented

Thoroughly documented with up-to-date JSON Schemas

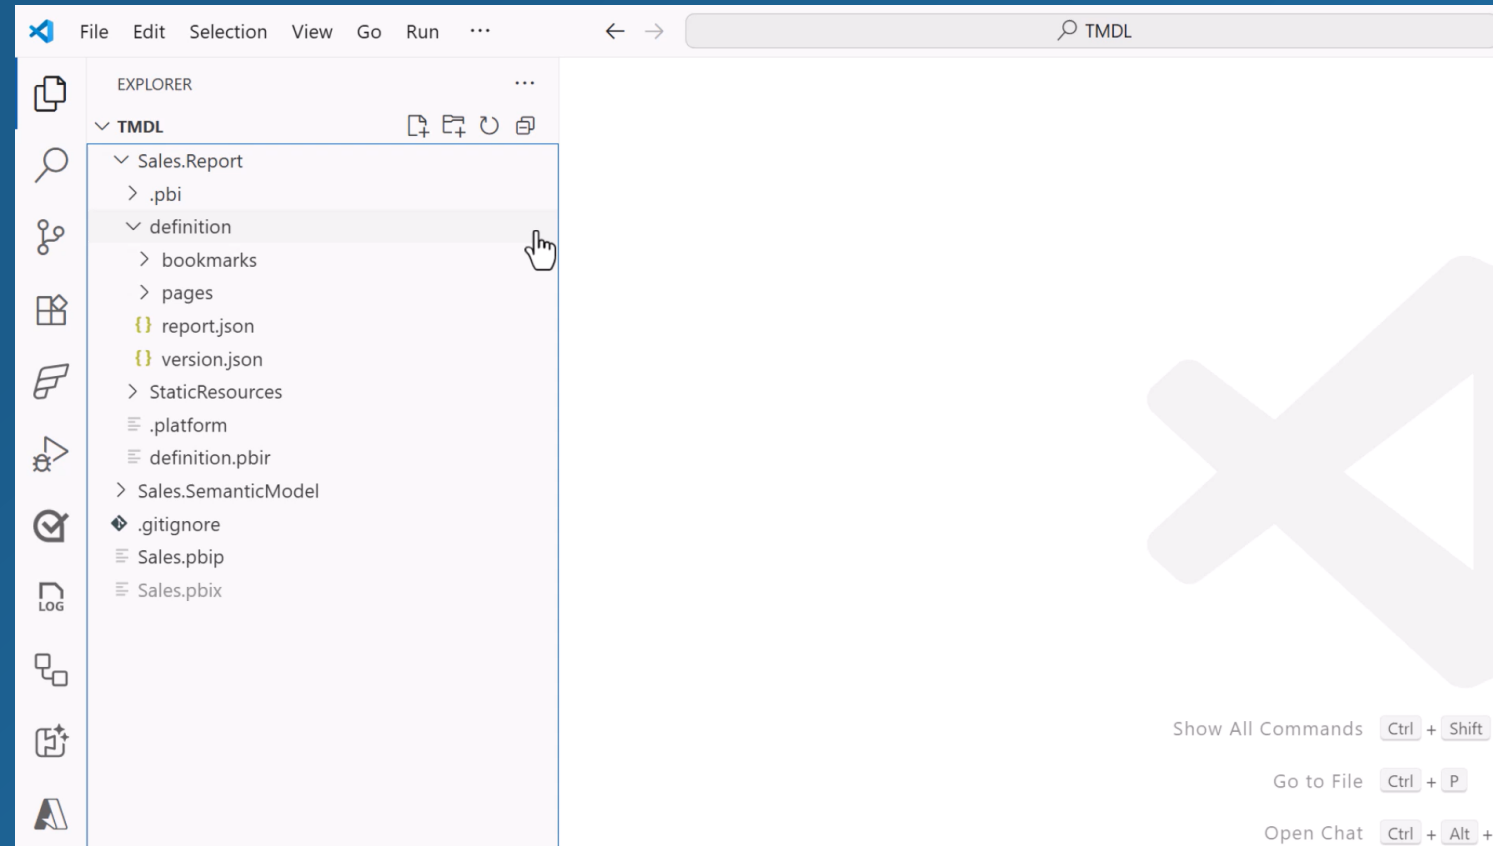

Developer-Ready

Source-control-friendly JSON folder structure.

Modular & Efficient

Copy-paste visuals/pages/bookmarks/... across reports.

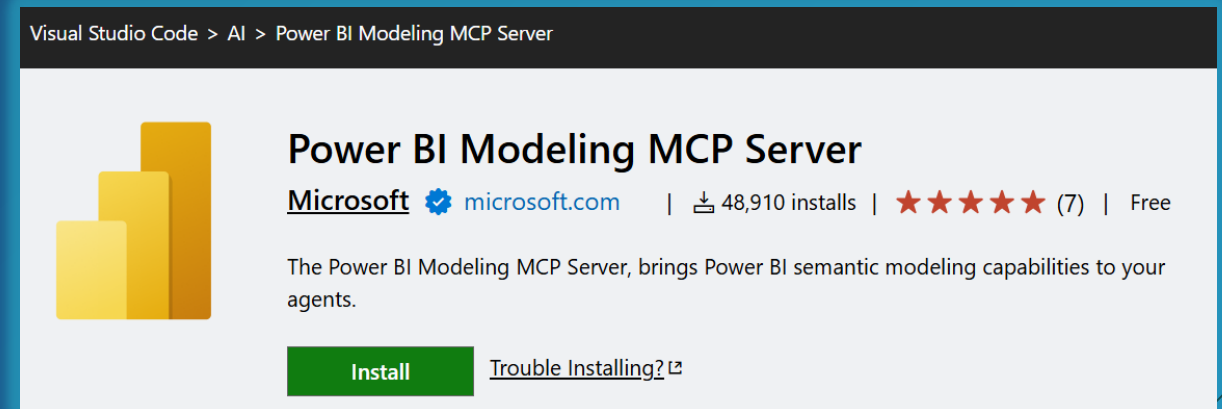

Demo(s)

Power BI Modeling MCP Server

Allows AI agents to interact with Power BI semantic models

- **Local MCP Server:** distributed as a VS Code extension
- **10x Efficiency:** Easily apply bulk changes turning hours of work into seconds; enforce team best-practices and more
- **Agentic workflows:** Together with skills and context unblock powerful E2E AI development workflows
